

## Five Reasons to Move from Windows to Silverlight

1. Secure web access without the costs involved in Terminal Server licensing and maintenance. Users in remote locations gain the most by the improved response time compared to Terminal Server, especially in terms of using their local Office Applications on the end user's machine in conjunction with Priority: a "life changer" for remote users in terms of functionality, convenience and speed.

2. Synchronization with end user's installed Outlook and data exchange with other Office applications on their client machine, significantly on laptops.

3. Significant saving in infrastructure costs as one Silverlight application server can support over 100 concurrent remote users vs. 20 users with similar server configuration on Terminal Server.

4. Greatly improved user level customization capabilities, including "drag and drop" enabled report generators and more.

5. New and improved UI design with emphasis on visibility and quick access to most functionality that a user needs to have a key or mouse click away.
